```
The present invention relates to new NOVX polypeptides. The invention is useful for treating or preventing a NOVX-associated disorder such as cardiomyopathy or atherosclerosis, where the disorder is related to cell signal processing and metabolic pathway modulation in a subject, signal processing and metabolic pathway modulation in a subject, or preferably human. The invention is also useful for treating metabolic disorders (e.g. obesity), diabetes, infectious disease, neurodegenerative disorders, haematopoietic disorders and various cancers. The molecules of the invention are also useful for treating or preventing cirrhosis. Cancertis, acne, hair growth, pigmentation disorders, endocrine disorders, respiratory disease, gastro-intestinal diseases, reproductive, health, neurological diseases, bone marrow transplantation, endocrine diseases, allergy and inflammation, nephrological disorders, urinary system disorders, neuropsychatric disorders and age-related disorders. The present nucleic acid sequence represents a PCR primer that was used in the methods of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gangolli EA, Patturajan M, Vernet CAM, Malyankar UM, Kekuda R;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a differential display comprising contacting cond, with a first primer that hybridises to an oligonucleic sequence coding for a leucine-rich motif, and with a second oligonucleotide primer to form a cDNA-hybrid molecule. The method comprises obtaining mRNA from at least 2 samples, synthesising CDNA from the RNA of each sample. Contacting the cDNA with a first primer that hybridises to an oligonucleotide primer to form cDNA-hybrid molecules, amplifying the oligonucleotide primer to form cDNA-hybrid molecules, amplifying the collgonucleotide primer to form cDNA-hybrid molecules, amplified products amplified products coding for at least one secreted or transmembrane protein. The method is useful for discovering novel secreted and/or transmembrane method is useful for discovering novel secreted and/or transmembrane collent are important for cell processes and play an important cole in determining its phenotype, and which act as mediators for the transfer of signals from external environment into the cell itself, thus modulating gene expression. Sequences ABX03792-ABX03869 represent DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  cell signal processing, metabolic pathway modulation, metabolic disorder, obesity, diabetes; infectious disease, neurodegenerative disorder; acne; Alzheimer's disease; Parkinson's disease; immune disorder; cancer; haematcopoietic disorder; cirrhosis; pancreatitis; learning defect; memory defect; infertility; congenital heart defect; hair growth, pigmentation disorder; endocrine disorder; respiratory disease; health; gastro-intestinal disease; reproductive; neurological disease; health; bone marrow transplantation; endocrine disease; allergy; inflammation; nephrological disorder; urinary system disorder; age-related disorder;
                                                                                                                                                                                                                                                                                                                                                                                                                                                             Differential display method for identifying secreted or transmembrane protein, comprises contacting a DNA with a first primer that hybridizes to a sequence coding for a leucine-rich motif and with a second

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Fragments of a mouse cosmid clone, Malphacd#9, known to contain
exon sequences of the Na, R-ATFase alphal subunit gene (Tam, S.-
Y., et al., Mol. Cell. Biol. 10:6619-6623 (1990) were used to
demonstrate that when a fragment contg. an entire exon with
flanking intron sequences (in the proper orientation) is inserted
into an intron of an in vivo splicing plasmid, the exon is retained
in the mature poly A+ cytoplasmic RNA. In vivo splicing plasmid
DSPLI was used. The insertion site is within an intron from the
HIV-1 tat gene whose flanking exons and splice sites were substituted
for the second intron of the rabbit beta-q-lobin gene.
Oligonucleotide pairs for PCR are represented in AAQ27300-01).
The antisense primers DHAB14 and SA2 (AAQ27299 and AAQ27301) were used
as primer in the first strand cDNA synthesis reactions.
SDI and SA1 (AAQ27302-03) are internal to the initial RNA/PCR prod.
and were used for reamplification of RNA/PCR prods.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

2'-0-CH2-CH2-O-CH3 and 2'-deoxy sugar moieties, useful for therapy

```
The invention relates to oligonucleotides (A), which specifically chiefless to RNA or Diagonucleotides (A), which specifically hybridises to RNA or DNA, comprises a linear sequence of nucleotide units linked by phosphodiseter or phosphorothicate linkages, comprising a first subsequence having 2'-0-H2-CH2-O-CH3 organ moieties and a second cultural accordance having 2'-deoxy sugar moieties. (A), which has RNASSH cativity for leaving a complementary strand, can be used to modulate the expression of ras, raf and protein kinase C genes, useful in the therapy of aberrant cell growth in humans, animals or plants. (A) can also be used diagnostically, particularly when labelled, to detect overexpression of mRNA or expression of abnormal RNA, including imaging of tissue sections, and as a research reagent. (A) has increased binding affinity for complementary strands (attributable to the 2'-O-CH2-CH2-O-CH3 sugar links), and increased resistance to nuclease (from the modified links and the collections).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human; adenomatous Polyposis coli; APC; diagnosis; prognosis; neoplastic tissue; tumour tissue; tumour repressor; mutation; sporadic colorectal cancer; detection; PCR primer; SRP19; SSCP; single stranded conformation polymorphism; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Hedge PJ;

Cancer diagnosis - by detecting mutation(s) in adenomatous polyposis
                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                        The present sequence is a primer for the SSCP analysis of SRP19, which was used in the development of a novel method of diagnosing or prognosing a human adenomatous Polyposis coli (APC) gene associated neoplastic tissue. The method comprises comparing APC gene coding sequences or mRNA in a tumour tissue, to APC gene coding sequences or mRNA in a non-neoplastic tissue, where a difference indicates an APC gene associated neoplasia of the tumour tissue. APC is a tumour repressor expressed in most normal tissues. APC mutations are found in familial adenomatous polyposis and sporadic colorectal cancer patients. The method enables mutations
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New Alzheimer's disease related gene, AD4 - used to develop prods.

                                                                           A genetically isolated group of families with autosomal dominant early-onset Alzheimer's Disease (AD) has been studied and initial mapping analyses have predicted the AD4 locus (also known as STWA) resides on chromosome 1. The present sequence corresponds to a PCR primer which was used during the cloning procedure to isolate and sequence the AD4 gene. The group of families has been designated the Volga German (VG) kindreds. The entire gene has been amplified from VG individuals and unaffected individuals (from VG and unrelated lineages). Sequence analysis has shown that affected individuals have a nucleotide change at codon 141 resulting in an especially one in which Asn at position 141 has been replaced by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Brassica species allele-specific oligonucleotide probes and primers - useful for plant breeding
                                                                                                                                                                                                                                                                              Ile, can be used in a peptide vaccine. Detection of mutant AD4, for example using antibodies specific for the protein or using nucleic acid probes specific for the mutant gene, provides a means of
for detecting pre-disposition to or for diagnosis, prevention or treatment of Alzheimer's disease
                                                                                                                                                                                                                                                                                                                                                                                                                                        0

Such markers cabe used in the construction of allele-specific primers and probes for amplification or hybridisation, e.g. to determine common or disparate ancestry between 2 or more plants, to monitor the genetic contribution of an ancestral plant, to trace the progeny of proprietary plants, in certification of a hybrid plant or to identify the progeny of a back-crossed plant with an ancestral plant.

         AAV56477-V56581 are primers used in the isolation of a human familial adenomatous polyposis coli (APC) protein from clone DP2.5. The gene for the protein is present on human chromsome $241 and is also referred to as adenomatous polyposis coli gene. It is a tumour suppressor gene, and mutations in this gene have been associated with tumourigenesis in retinoblastoma and colorectal tumours, and especially familial adenomatous polyposis (RAP) and Gardner's Syndrome (GS). The protein can be used in therapy to replace lack of native functional protein and the nucleic acids can be used for gene therapy. The nucleic acids that encode them can also be used as probes and primers in detection of the cancers and predisposition to it.

                                                         The present sequence is a primer for the SSCP analysis of SRP19, which was used in the development of a novel method of diagnosing or prognosing a human adenomatous Polyposis coli (APC) gene associated neoplastic fissue. The method comprises comparing APC gene coding sequences or mRNA in a tumour tissue, to APC gene coding sequences or mRNA in a non-neoplastic tissue, where a difference indicates an APC gene associated neoplasis of the tumour tissue. APC is a tumour repressor expressed in most normal tissues APC mutations are found in familial adenomatous polyposis and sporadic colorectal cancer patients. The method enables mutations

The present sequence represents a primer for the wheat viviparous 1 (VPI) gene, which keeps mature seeds dormant and inhibits germination. The present invention describes genes which are homologues of the maize Viviparous 1 gene, obtained from oat Avena fatua and wheat which encode bolypeptides designated afVPI and taVPI respectively. The VPI activity keeps mature seeds dormant and inhibits germination and can be used to maintain or impose sufficient intensity and diration of dormancy to avoid pre-harvest sprouting (PHS) before harvest. The products can be used in the production of transformed crop plants having desirable primary or secondary dormancy. or after-ripening properties, and in particular may be resistant to PHS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        modified; deoxyfuranosyl moiety; therapy; infection;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present sequence represents a phosphorothioate antisense oligonucleotide which a gapped 2' modified oligonucleotide, whereby one part has at least two consecutive 2-F (2-H) nucleotides and the second part has at least five consecutive nucleotides with 2'-H sugar moieties. The modified oligonucleotide has increased nuclease resistance, and increased binding affinity for substrates. The oligonucleotide elicits RNase H strand cleavage of specific RNas oligonucleotide elicits RNase H strand cleavage of specific RNas oligonucleotide conditions as succeptible to oligonucleotide therapeutics

The invention relates to a nuclease resistant compound that hybridises with RNA or DNA. The compound comprises covalently-bound nucleosides that individually include a ribose or deoxyribose sugar portion and a base portion, where the nucleosides are joined together by nucleosides internucleoside linkages such that is complementary to a RNA base sequence form a mixed base sequence; and where at least 1 of the nucleosides or to a DNA base sequence; and where at least 1 of the nucleosides includes a modified deoxyfuranosyl moiety bearing a 2'-substituent selected from cyano, fluoromethyl, thioalkoxyl, alkylsulphinyl, allyloxy and alkeneoxy groups. The nuclease resistant class alkylsulphonyl, allyloxy and alkeneoxy groups. The nuclease resistant close used for treating organisms having a disease characterised by the undesired production of a protein. They can be used in therapeutic cor prophylactic treatment in organisms such as bacteria, yeast, protozoa algae, plant and higher animal forms inflections and diagnosis. The ONS provide enhanced binding to terresting inflections and diagnosis. The ONS provide sequence-specific ONS provides superior potency and specificity compared to phosphorus-modified ons the present sequence represents a compared to phosphorus-modified ons the present sequence represents a construction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö

The invention relates to a novel method for detecting Adenomatous Polyposis Coli (APC) protein in a sample. The method involves contexting the sample with antibodies which specifically binds to the contexting the sample with hutilibodies which specifically binds to the protein, and detecting an APC-antibody complex. Mutations in the APC gene play a role in tumorigenesis, indicating that it is a tumour contemplate of the APC gene play a role in tumorigenesis, indicating that it is a tumour the FAP (familial adenomatous polyposis) locus. FAP is an autosomal dominant inherited disease in which affected individuals developm to the FAP (familial adenomatous polyposis) locus. FAP is an autosomal dominant inherited disease in which affected individuals developm to some of which progress to malignancy. The FAP locus is often found to some of which progress to malignancy. The FAP locus is often found to be deleted in sporadic (i.e., non-familial) adenomas and carcinomas, and chromosome 5g deletions have also been observed in tumours of the lung, breast, colon, rectum, bladder, liver, sarcomas, stomach, and prostate, and in leukaemias and lymphomas. Although the FAP locus contains of several other genes such as FBK, TBJ, TBZ, and MCC, it is thought that mutations in the APC gene play a key role in the development of FAP and sporadic tumours. The method is useful for detecting APC protein and its mutations in the APC gene play a placental tissue, aministic fullid, blood, cancer, for detecting germiline and somatic alteration of will drype APC genes, and for testing therapeutic agents for the ability to suppress tumours. Sequences AAA93490-A93499 represent PCR primers used in an example in the APC and primer way in a normal processing the averagion of the human contains approached by a sequence of the human contains of the human contains of the human contains apple appressing to a normal processing the averagion of the human contains apple appressing to a normal processing to a normal processing to a normal processing to a
                                                                                                                                                                                                                                                                                                                                                               Detecting Adenomatous Polyposis Coli (APC) protein in a sample for diagnosing cancers, involves contacting the sample with antibodies that specifically bind to APC protein and detecting the complex formed -

The present invention relates to a hairpin or hammerhead ribozyme, designed to cleave RNA encoding a cyclin or cell-cycle dependent kinases other than cell-cycle dependent kinases CDK1, PCNA and Cyclin B1.
Representative examples of ribozyme recognition sites are given in AAA82415 to AAA86787. The ribozyme of the invention is useful for inhibiting restenosis by introduction of the ribozyme into cells. The ribozyme is resistant to endonuclease activity and hence is efficient in restenosis treatment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 /*tag= c

oligonuclectides and to oligonuclectides that elicit RNase H for cleavage in a complementary nucleic acid strand. It also relates to cleavage in a complementary nucleic acid strand. It also relates to cleavage in a complementary nucleic acid strand. It also relates to cligonuclectides wherein at least some of the nucleotides include a substituent that potentiates hybridisation of the nucleotides include a 2'-decxy-exythro-pentofurancyl sugar moiety. The nucleotides include a 2'-decxy-exythro-pentofurancyl sugar moiety. The inclusion of one or more aminoxy moieties in such oligonucleotides to a complementary strand. The oligonucleotides to a complementary strand. The oligonucleotides of the invention are used as diagnostic, therapeutic or research reagents, and can be used to modulate modified nucleosides have increased nuclease resistance and increased
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                represents a phosphorothioate oligonucleotide used in an exemplification of the present invention which has 2'-substituted regions flanking a

The invention relates to 40 human secreted proteins (AAV94981-V95020),
and cDNA sequences encoding them (AAA23423-A23462). The secreted
control of the invention include those that are thought to be only
proteins of the invention include those that are thought to be only
partially secreted, i.e., transmembrane proteins. The proteins of the
corporation may exhibit one or more activities selected from the following:
corporation activity, cell proliferation; differentiation; immune
modulation; haematopoiesis regulation; tissue growth activity;
condition activity; anti-inflammatory activity; and tumour
activin/inhibin activity; anti-inflammatory activity; and tumour
condition activity. The proteins may be administered to patients as
condition activity anti-inflammatory activity; and tumour
condition activity. The proteins may be used as part of a gene therapy
concludes of the invention include autoimmune diseases; genetic
disorders, haemophila; cardiovascular diseases; cancer; bacterial,
concluders, haemophila; cardiovascular diseases; denetic
disorders, haemophila; cardiovascular diseases; bacterial,
concluders, cardiovascular diseases; denetic
disorders, haemophila; cardiovascular diseases, denetic
constituin dependent diabetes mellitus; and allergic reactions such as
concluders, osteoporosis, osteoarthritis, periodontal diseases, Alzheimer's
concluders, coreoporosis, osteoarthritis, periodontal diseases, Alzheimer's
concluders, pervention may also be used for treating wounds, burns,
disease, parkinson's disease, Huntington's disease and amyoricophic
conditionally be useful as contraceptives. Nucleic acid sequences of the
converse and northers and nuches Reminence and sequences of the
converse and nuches and nuches Reminence and represent

```
The present sequence is that of a primer used in the PCR amplification of the open reading frame of a cDNA clone (see AAZ94150) encoding human phosphatidylethanolamine N-methyltransferase-2 (PEMT-2, see AAY79199). The PCR product was subcloned into mammalian expression vector pCI, and PEMT-2 was expressed in rat hepatona McArdle-RH777 cells. The invention relates to novel human PEMT2 polynucleotides and protein (see AAY79199), and to methods of using them in the treatment and diagnosis of liver disorders, such as liver cancer.

The present invention describes nuclease resistant oligonucleotides (I) comprise comprising 2.* fluoro modified ribofuranosy1 nucleotides. (I) comprise covalently bound nucleotides, where the nucleotides are joined together by: (a) internucleotide linkages such that the base portion of the nucleotides forms a mixed base sequence; and (b) at least one of the nucleotides includes a modified ribofuranosy1 group bearing a 2.* fluoro substituent; provided that at least two of the nucleotides are 2.* fluoro substituent; provided that at least two of the nucleotides are 2.* fluoro substituent; provided that at least two of the nucleotides are 2.* fluoro compliced ribofuranosy1 nucleotides when the internucleotide linkages are phosphodiester nucleotides. (I) bind to their target mRNA and inhibit its expression. (I) are resistant to nuclease degradation and hybridise with the appropriate strength and fidelity to its target RNA/DNA. (I) are also useful as research agents, diagnostic agents and as oligonucleotide therapeutics. (I) may be used to treat atherosclerosis following the ungloblasty to prevent reocclusion of the treated arteries. (I) may also be used in conjunction with AZT to treat AIDS patients. (I) have been cused to modulate the expression of RAF gene, a cellular gene whose the conjunction implicated in abnormal cell province and a conjunction and province in a phonomal cell province of the invarience.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     tumour formation. (1) are also used to modulate the expression of protein kinase C. (1) exhibit hybridisation properties of higher quality than phosphorous modified oligonucleotide duplexes containing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          methylphosphonates, phosphoramidates and phosphate triesters. The present sequence represent an oligonucleotide used in the exemplification of the
Nuclease resistant oligonucleotides useful as research agents, diagnostic agents, and in the treatment of atherosclerosis and AIDS
                                                                                                                                                                                                       Example 19; Column 40; 49pp; English.

ô ribosomal RNA (rRNA) antisense oligomers. These sequences are antibacterial compounds comprising substantially uncharged antisense oligomers containing 8-40 nucleotide subunits, including a targeting nucleic acid sequence at least 10 nucleotides in length which is complementary to a bacterial 16 sor 23S rRNA nucleic acid sequence. The antisense oligomers are used for treating a bacterial infection in a human or a mammalian animal produced by Escherichia coli, Salmonella typhimurium, Pseudomonas aeruginosa, Vibrio cholera, Neisseria choorsthoea, Helicobacter pylori, Bartonella henselae, Haemophilus influenza, Shigella dysenterae, Staphyloococus aureus, Mycobacterium tuberculosis, Streptococcus pneumoniae, Treponema palladium and Chlamydia trachomatis. The antibacterial compound may be used as a food grain supplement in livestock and poultry food composition. Antibacterial compound, useful for treating bacterial infections and as livestock and poultry food supplement, comprises antisense oligonucleotides complementary to bacterial 16S and 23S rRNA -Gaps AAS11035-AAS11157 represent the coding sequences of bacterial 16S ·; 1.0%; Score 13.8; DB 1; Length 19; 88.2%; Pred. ```
The present invention describes a method for treating a proliferative skin or eye disease and scarring. The method involves administering a ribozyme (I) which cleaves RNA encoding a cytokine involved in inflammation, matrix metalloproteinase (WMP), cyclin, cell-cycle dependent kinase, growth factor or a reductase, or administering a nucleic acid molecule (II) comprising a promoter operably linked to a nucleic acid segment encoding (I). (I) can have antipsoriatic, and expending (I). (I) can have antipsoriatic, and experimentation optimal mological, cytostatic, antiseborrheic, antidiabetic, antidiation, cleaves RNA encoding cytokine involved in inflammation. (I) can be used in gene therapy. (I) and (II) are useful for treating proliferative skin diseases such as psoriasis, atopic dermatitis, actinic keratosis, skin diseases such as psoriasis, atopic dermatitis, actinic keratosis, also be used for treating proliferative eye diseases such as diabetic retinopathy, vitreoretinopathy, sickle cell retinopathy, retinopathy of prematurity and retinal detachment, and for treating and preventing scarring such as keloid, adhesion and hypertrophic or hypertrophic burn car. AMHS7577 to AMH62099 represent sequences used in the exemplification of the present invention.
ribozymes that cleave RNA encoding cytokines involved in inflammation, matrix metalloproteinases, growth factors and cell-cycle dependent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

The present invention relates to a method for haplotyping the human phospholipid transfer protein (PLTP) gene, involving determining the identity of the nucleotide present at one or more of the 25 polymorphic sites within the gene. This can be used to aid drug development for the
                                                                                                                                                                                      This invention relates to a novel method to aid in the diagnosis or prognosis of a neoplastic tissue of a human. The method involves detecting sometic alteration of wild-type adenomatous polyposis coli) protein in a tumour tissue isolated from a human (the alteration indicating neoplasia of the tissue). The method of the invention is useful in diagnosis or prognosis of a neoplastic tissue of a human. the method is useful in detection of genetic predisposition to cancer. The present sequence represents a DNA sequence used in the method
                                                                Method to aid in the diagnosis/prognosis of neoplastic tissues in humans, by detecting somatic alteration of wild-type APC protein in tumor tissue isolated from human, the alteration indicating neoplasia
                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human, phospholipid transfer protein, PLTP; SNP, atherosclerosis,
single nucleotide polymorphism, high-density lipoprotein metabolism,
allele-specific oligonucleotide, probe; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human phospholipid transfer protein gene ASO probe SEQ ID NO: 20.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Genotyping phospholipid transfer protein gene of individual for haplotyping individual's gene, comprises determining identity of nucleotide pair at polymorphic sites for two copies of PLTP gene
                                                                                                                                                                                                                                                                                                                                                                                                                                              .

Specifically, the invention relates to the discovery of 20 novel polymorphic sites within the LIPG gene. The LIPG coding sequence and protein are useful for screening drugs that can be used to treat atherosclerosis and other cardiovascular disorders. The LIPG coding sequence can also be used to haplotype and genotype the LIPG gene of an individual. The DNA sequences ABL91822 - ABL91861 represent LIPG gene allele specific oligonucleotide primers.
                 gene, possibly including atherosclerosis. The present sequence is an allele-specific probe used for detecting polymorphisms in the PLTP gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human; ss; allele specific oligonucleotide; primer;

The invention relates to single nucleotide polymorphisms in the gene encoding the human phospholipid transfer protein (PLTP). A method for haplotyping the PLTP gene in an individual comprises identifying the nucleotide at one or more polymorphic sites and determining whether one of the specification or whether both copies are defined by a haplotype given in the specification or whether both copies are defined by a haplotype pair. This method is useful in genotyping, whereby all possible haplotype pair. This method is useful in genotyping, whereby all possible haplotype pair and a haplotype or haplotype pair of the haplotype or haplotype pair in a reference population, where a higher haplotype or haplotype pair in a reference population, where a higher haplotype or haplotype for haplotype or haplotype for nation indicates the trait is associated with the haplotype or haplotype pair. Purp and its corresponding DNA are used for studying the expression and function of PUTP, for use in screening for candidate drugs to treat diseases related to PLTP activity. The sequences are also useful for studying the effect of variation on the biological activity of PLTP as well as on the binding affinity of candidate drugs targeting PLTP for treating atherosclerosis. Sequences ASS94691 represent allele-specific oligomucleotide probes, sequencing primers and PCR primers used for detecting PLTP gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ;

```
of or diagnosing Alzheimer's disease using single nuclectide polymorphisms (SNPs) present in an individual's mitochondrial DNA (mtDNA). In additon, the SNPs identified can be used to identify agents suitable for use in treating Alzheimer's disease. Sequences AAC67301-C67610 are PCR primers used to demonstrate the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   present invention describes a novel method for determining the risk

The present invention describes a method for the quantification of extramitochondrial DNA (exmtDNA) by determining the ratio of a first and search biological sample containing exmtDNA and mitochondrial DNA (m.DNA) to determine the risk or presence of a disease associated with altered mitochondrial function. The method can be used to determine the risk of or presence of a disease associated with altered mitochondrial function, especially Alzheimer's disease, Huntington's disease, Parkinson's disease, dystonia, schizophrenia, non-insulin dependent diabetes mellitus, mitochondrial encephalopathy, lactic dependent diabetes mellitus, mitochondrial encephalopathy, lactic acidosis, stroke, myoclonic epilepsy ragged red fibre syndrome and leber's hereditary optic neuropathy. The method can also be used to identify agents sultable for treating such diseases, in particular Alzheimer's disease. AAZ57202 to AAZ57313 represent nucleotide sequences used in the exemplification of the present invention. More specifically and such and such also be used to season in the exemplification of the present invention. More specifically
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    RT-PCR primer; DNA sequence determination; gene sequence analysis; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        AAZ57206 to AAZ57313 are PCR primers used in the detection of exmtDNA

Peptides having at least two new nucleotides - useful as primers in Disclosure; Page 10; 19pp; Japanese. WPI; 1999-183822/16

This sequence represents a primer of the invention. The invention relates to sequences of at least two nucleotides of formula:

(X)m5'-(alphain-beta-N3'; or (X)m5'-(gamma)k-delta-N3'; where x = alabelled compound and/or a nucleotide with voluntary sequence; m = 0 or 1; alpha = thymine; n = natural number indicating the repetition of alpha; beta, delta = V or N; V = adenine, guanine or cytosine; N = adenine, guanine, cytosine or thymine; gamma = thymine; k = natural number of 3 or over indicating the repetition of gamma, in which thymine expressed by gamma is composed of 1/3 or less of adenine, guanine and/or cytosine. The new nucleotides are useful as primers for XT-PCR and determination of base sequences. The new sequences allow for reproductive and highly efficient analysis of gene sequences.

New oligonucleotides, nucleic acid probes and primers are useful for differentiating drug-resistance and determining infection with tubercle bacilli

Claim 10; Page 25; 114pp; English.

The present invention relates to oligonucleotides based on nucleotide sequences obtained from both wild-type tubercle bacilli (wtTB) that are susceptible to a drug and mutant-type tubercle bacilli (mtTB) that are resistant to a drug. The drugs used in the present invention are rifampicin (RFP), streptomycin (SM), kanamycin (KM), isoniazid (INH) and

ethambutol (EB). The rpoB gene is responsible for resistance to RFP; the responsible for resistance to SM and KM; the rpsL gene is responsible for resistance to SM; the inhA gene is responsible for resistance to INH, the katG gene is responsible for and the embB gene is responsible for resistance to INH; and the embB gene is responsible for resistance to EB. The present invention also relates to nucleic acid probes having part of a nucleotide sequence of tubercle bacilli (TB) responsible for drug resistance and primers used to generate the probes. The present sequence is an present invention can be used to enable the differentiation of drug resistance and the determination of infection with tubercle bacilli simultaneously.

Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or inflammation

Claim 15; Page 115; 201pp; English.

The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an antisense oligonuclectide, (for Insulin-like Growth Factor [IGF]-1 receptor, IGF binding protein [IGFBP]-2 or IGFBB], which is capable of inhibiting or reducing growth factor maddated cell proliferation, inflammation and/or other disorders. The present sequence is one such antisense oligonuclectide. The method is useful for ameliorating the

Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or inflammation

Example 6; Page 42; 201pp; English.

The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an antisense oligonuclectide, (for Insulin-like Growth Factor [167]-1 receptor, IGF binding protein [IGFBP]-2 or IGFBP3), which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligonuclectide which can be used to design the antisense oligonuclectides of the present invention (see AAF45151 and AAF45153-F55161). The method is useful for ameliorating the effects of psoriasis, ichthyosis, pityriasis, ruba, plaris, serborrhoea, keloids, keratosis, neoplasias, scleroderma, warts, benign growths, cancers of the skin, a hyperneovascular condition as a meovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other

Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or inflammation

Example 6; Page 42; 201pp; English.

The present invention relates to a method for ameliorating the effects
of skin disorders. The method comprises contacting the skin with an
antisense oligonuclectide, (for Insulin-like Growth Factor [IGF]-1
receptor, IGF binding protein [IGFBP]-2 or IGFBP3), which is capable of
inhibiting or reducing prowth factor mediated cell proliferation,
inflammation and/or other disorders. The present sequence is an
oligonuclectide which can be used to design the antisense
oligonuclectide which can be used to design the antisense
oligonuclectide which can be used to a mealiorating the effects of
psoriasis, ichthyosis, pityriasis, ruba, pilaris, serborrhoea, keloids,
keratosis, neoplasis, pityriasis, ruba, pilaris, serborrhoea, keloids,
keratosis, neoplasis, cleroderma, warts, benign growths, cancers of the
skin, a hyperneovascular condition such as a neovascular condition of the
retina, brain or skin, growth factor-mediated malignancies, other
condition of the inside of blood vessels or any other hyperplasia.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                oligonacleotides of the present invention (see AAF45151 and AAF45153 F45161). The method is useful for ameliorating the effects of psoriasis, ichthyosis, pityriasis, ruba, pilaris, serbornhoea, keloids, keratosis, neoplasias, soleroderma, warts, benign growths, cancers of the skin, a hyperneovascular condition such as a neovascular condition of the sclero, brain or skin, growth factor-mediated malignancies, other sclerotic disease, kindy disease, hyperproliferation of the inside of blood vessels or any other hyperplasia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an antisense oligomucleotide. (for Insulin-like Growth Factor [IGF] -1 receptor, IGF binding protein [IGFBP] -2 or IGFBP3), which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligomucleotide which can be used to design the antisense
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or inflammation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Match 1.0%; Score 13.4; DB 1; Length 15; Local Similarity 93.3%; Pred. The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an antisense oligonuclectide, (for Insulin-like Growth Factor [IGF]-1.

receptor, IGF binding protein [IGFB]-2 or IGFBP3), which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligonuclectide which can be used to design the antisense oligonuclectide which can be used to design the antisense oligonuclectide which can be used to design the effects of AAP45153-F45161. The method is useful for ameliorating the effects of psoriasis, ichthyosis, pityriasis, ruba, pilaris, serborrhoea, keloids, keratosis, neoplasias, scleroderma warts, benign growths, cancers of the skin, a hypernevascular condition such as a neovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other celina, brain or skin, growth factor-mediated malignancies, other condition of the inside of blood vessels or any other hyperplasia.

Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or inflammation.

Example 8; Page 78; 201pp; English.

The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an antisense oligonucleotide, (for Insulin-like Growth Factor [IGR]-1 receptor, IGR binding protein [IGRBP]-2 or IGRBP3, which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligonucleotide which can be used to design the antisense oligonucleotide which can be used to design the antisense oligonucleotides of the present invention (see AAF45151 and AF4545152 Pf5161). The method is useful for ameliorating the effects of psoriasis, ichthyosis, pityriasis; ruba, pilaris, serborrhoea, keloids, keratosis, neoplasias, Sclaroderma, warts, benign growths, cancers of the seting and a provise of the seting and a retina, brain or skin, growth factor-mediated malignancies, other sclerotic disease, kidney disease, hyperproliferation of the inside of blood vessels or any other hyperplasia.

Isolated nucleic acid molecules having polymorphisms in known human genes e.g. cytochrome p450 and cathepsin S useful as genetic linkage markers for locating, identifying and characterizing the genes responsible for disorder-related traits

Example 2; Page 101; 714pp; English.

This invention relates to the sequence of an isolated nucleic acid molecule comprising at least one base variation from that of a known human cytochrome P450 A1 (CYP450121), adrenergic receptor beta1 (PABRI), cytochrome P450 O21 (CYP450121), adrenergic receptor beta1 (ADBRI), cytochrome P450 O21 (CYP450121), adrenergic receptor beta1 (ADBRI), cytochrome P450 O21 (CYP450121), adrenergic receptor nuclear translocator (ARN), cathepsin S (CTSS), cyclooxgenase 2 (CXCZ), diazepam binding inhibitor (DBI), epoxide hydrocarbon receptor nuclear translocator (ARNT), cathepsin S (CTSS), cyclooxgenase 2 (CXCZ), diazepam binding inhibitor (DBI), epoxide hydrocylase 2 (EDRX2), 5-lipoxygenase 2 (ARNT), cathepsin S (CTSS), dutathione-S-transferase 12 (GYCTS), diazepam binding cativating protein (FARNT), NADPH quinone oxidoreducase 2 (NQC2), alstanie-N-methyl transferase 2BH (UGT2BH), UDP-glucuronosyl transferase 2BH (UGT2BH), UGT2BH, UDP-glucuronosyl transferase 2BH (UGT2BH), UDP-glucuronosyl transferase 2BH (UGT2BH), UDP-glucuronosyl transferase 2BH (UGT2BH), UGT2BH, UDP-glucuronosyl transferase 2BH (UGT2BH), UDP-glucuronosyl transferase 2BH (UGT2BH), UDP-glucuronosyl transferase 2BH (UGT2BH), UGT2BH, UDP-glucuronosyl transferase 2BH (UGT2BH), UDP-glucuronosyl transferase sontained individuals for altered secential individuals for altered secential individuals for altered secential individuals

primers AAT06887-932 were used to analyse the breakpoints at chromosomal locus 8p22-21, contained in patients having prostate cancer, by microsatellite analysis and sequence taggaded sites (STS). The region contains a prostate/colon tunour suppressor gene (PTSG). The primers and amplified fragments were used to screen a YAC library of prostate diagnosis and treatment of prostate and colorectal cancer by the pigg (AAT06880), which can be used in the diagnosis and treatment of prostate and colorectal cancers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

RESULT 315 AAT06918

Sequence 15 BP; 3 A; 7 C; 2 G; 3 T; 0 other;

present sequence is NPY coding sequence

The present invention provides the human neuropeptide Y (NPY) gene and single nucleotide polymorphisms (SNPs) identified therein. The sequence can be used in the treatment of disorders associated with NPY, including atherosclerosis, obesity, psychological disorders and alcoholism. The present sequence is an allele specific primer used to isolate the human

New genetic variants of the human Neuropeptide Y (NPY) gene useful for treating disorders affected by abnormal expression or function of NPY isogene e.g., atherosclerosis or obesity  $\dot{\cdot}$

The P/CTS gene was isolated by analysis of allelic loss in patients with prostate cancer, and was putatively located to the chromosomal location #Q22-21 via microsatellite analysis and the use of sequence tagged sites (STS). Primers and probes derived from the gene can be used to screen lambda cDNA libraries for genes encoding P/CTS form 1 and 2. The P/CTS or its cDNA can be used in the diagnosis and treatment of prostate and colorectal cancers.

The present invention describes enzymatic nucleic acid molecules with CC RNA cleaving activity, which specifically cleave RNA encoded by an aryl hydrocarbon nuclear transporter (ARNY) gene, an integrin subunit betea 3 gene, an integrin subunit betea 3 gene, an integrin alpha 6 subunit gene, or a Tie-2 gene. AAA16775 to AAA1762 to AAA1762 represent their corresponding target sequences; AAA1762 to AAA1762 to AAA1762 to AAA1762 to AAA1763 to AAA1763 to AAA1915 to AAA1916 subunit, and AAA2335 to AAA2130 and AAA215 to AAA2168 represent their corresponding target sequences for integrin subunit beta 3, and AAA22476 to AAA23343 to AAA2342 represent their corresponding target sequences. The ribozymes of the invention are used for modulating the synthesis, expression and/or stability of an mRNA encoding angiogenic factor, especially AANT, integrin subunit beta-3, integrin subunit alpha-6, or Tie-2. They are considered to treat cancer, diabetric retinopathy, age related compaction (ARW), inflammation, and arthritis, as well as neovascular glaucoma, myopic degeneration, psoriasis, verruca vulgaris, corresponding target sequence conscileroms of tubercoms, myopic degeneration, psoriasis, struge Weber syndrome, Kippel-Trenaunay-Weber syndrome, Osler-Weber-Rendu syndrome, and other syndromes and diseases related to the levels of ARNT, Tie-2, integrin subunit alpha-6, or integrin subunit beta-3.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                             Novel ribozymes for modulating the synthesis, expression and/or stability of an mRNA encoding an angiogenic factors \,

                                                                                                                                                                        comprises a live commensal oral organism genetically modified to express multiple immunogenic fragments of the pathogen. The composition has antibacterial and antiviral activity and acts as a vaccine. The composition has composition which is administered orally or intranasally, is used for prophylactically treating a host against infection by a pathogen such as prochylactically treating a host against infection by a pathogen such as preming occores, respiratory syncytial virus, poliovirus, Mycoplasma premingluenza, Corynebacterium diphtheriae, Clostridium tetani, hepatitis parainfluenza, Corynebacterium diphtheriae, Clostridium tetani, hepatitis or their combinations. The composition can also be used for chronic their combinations. The composition can also be used for chronic sequence represents a PCR primer used to amplify a Bordetella pertussis DNA sequence, which is used in an example illustrating the use of the

A method has been developed for detecting the presence or absence of a single nucleotide polymorphism (SNP) allele in a genomic sample. The method comprises preparing a reduced complexity genome (RCG) from the genomic sample and analysing the RCG for the presence or absence of a SNP allele. The method can be used to characterise a tumour, to generate a genomic pattern for an individual genome or to generate a genomic classification code for a genome. The method can be used to assess whether a subject is at risk for developing a disease or to identify a set of SNP alleles associated with a disease. The method can also be used to perform linkage analysis. AAA35944 to AAA35947 represent
                                                                                                                                                                                                                                                                                              The present invention relates to enzymatic and antisense nucleic acid molecules that act as inhibitors of the expression of repressor genes encoding the TR2 Orphan receptor, EAR3/COUP-TF-1, the GATA transcription factor gene, IRP-2 and/or the CAATT Displacement Protein (CDP). Inhibition of the repressors removes prevents inhibition (and consequently increases expression of) genes involved in the production of erythropoietin, granulocyte colony stimulating factor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Detection of single nucleotide polymorphisms in genomes by preparation and analysis of reduced complexity genomes, useful for genotyping, fingerprinting and determining allele frequency of SNPs
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human; single nucleotide polymorphism; SNP; genotyping; DNA analysis; allele specific oligonucleotide; ASO; reduced complexity genome; RCG; genomic classification; identification; by fingerprinting; tumour characterisation; hybridisation; BS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
Enzymatic and antisense nucleic acid inhibition of repressor genes, useful for producing e.g. granulocyte colony stimulating factor protein, interferon alpha and erythropoietin -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human genomic SNP allele specific oligonucleotide SEQ ID NO:169.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ..

The present invention describes nucleic acids (A) that interact stably with a target sequence and contain at least one phosphoro(di)thioate link, having endonuclease activity. (A), and more generally any catalytic nucleic acid (A) that modulates expression of the oestrogen receptor gene, are used to treat cancer (particularly of breast or canderium), in vivo or by transforming cells ex vivo and implanting treated cells, or for other conditions associated with levels of oestrogen receptor. Because of the high selectivity for targeted RNA, (A) can also be used to correlate inhibition of gene expression with alterations in phenotype, particularly for identification of therapeutic targets, and as research reagents (for RNA, in the same way that creativition andonucleases are used with DNA). The combination of modifications in (A) improves residence to nucleases, binding affinity and/or activity. AAA23503 to AAA4747 represent oestrogen receptor carriesponding target sequences, and AAA26107 to AAA2618 represent certoper receptor hairpin ribozyme sequences, and AAA26107 to AAA2618 represent centroper their corresponding target sequences, AAA25619 to AAA2611 represent corresponding corresponding target sequences.
                                                                                                                                 ö
sequences used in the exemplification of the present invention. AAA35948 to AAA36632 represent nucleotide sequences containing SNPs.
                                                                                                                                                                                                                                                                                                                                                                                                       Oestrogen receptor hammerhead ribozyme target sequence SEQ ID NO:2072
                                                                                                                                                                                                                                                                                                                                                                                                                                          Oestrogen receptor; c-raf; k-ras; bcl-2; ribozyme; cleavage; hammerhead ribozyme; hairpin ribozyme; antisense oligonucleotide; hammedification; cancer; phosphorothioate; endonuclease; anticancer; breat cancer; endometrium cancer; ss.

other ribozyme sequences and antisense oligonucleotides used in the exemplification of the present invention.

```
The present invention provides single-stranded oligonucleotides which can be used for the targeted alteration of genomic sequences, where the oligonucleotide has at least one mismatch compared with the genomic sequence to be altered. In particular, these sequences are directed at the following genes: adenosine deaminase, p53, beta-globin, retinoblastoma, BRCAL, BRA2, CFTR, cyclin-dependent Kinase inhibitor 2A (CDKMZA), APC, Factor V, Factor VIII, Factor IX, haemoglobin alpha locus (HBA1), haemoglobin alpha locus 2 (HBA2), MLH1, MSH2, MSH6, apolipoprotein E (APC), presenilin-1 (PSBN1) and presenilin-2 (PSBN2). These can be used in the gene therapy of diseases such as cancer, adenosine deaminase deficiency, cystic fibrosis, such as cancer, adenosine deaminase deficiency, cystic fibrosis, altahmer's disease, melanoma, adenomatous polyposis of the colon and various syndromes. The present sequence is one of the gene correcting

the invention.

oligonucleotides of

```
The present invention provides single-stranded oligonucleotides which can be used for the targeted alteration of genomic sequences, where the oligonucleotide has at least one mismatch compared with the genomic sequence to be altered. In particular, these sequences are directed at the following genes: adenosine deaminase, p53, beta-globin, retinoblastoma, BRCA1, BRCA2, CFRF, cyclin-dependent kinase inhibitor 2A (CDKNZA), APC, Factor VII, Factor IX, haemoglobin alpha locus 1 (HBA1), haemoglobin alpha locus 2 (HBA2), MLH, MSH2, MSH6, apolipoprotein R (APOE), LDL receptor (LDLR), UDP-glucuronosyltransferase (UGT1), amyloid precursor protein (APOE), presentlin-1 (PSENI) and presentilin-2 (PSENI2). These can be used in the gene therapy of diseases such as cancer, adenosine deaminase deficiency, cystic fibrosis, haemophilia, hypercholesterolesmia, thalassaemia, sickle cell anaemia, Alzheimer's disease, melanoma, adenomatous polyposis of the colon and
                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; gene therapy; adenosine deaminase deficiency; p53; beta-globin; retinoblastoma; BRCA1; BRCA2; CFTR; cystic fibrosis; cancer; Factor V; cyclin-dependent kinase inhibitor 2A; CDNCA3, melanoma; APC; HBA1; HBA2; adenomatous polyposis of the colon; Factor VII; Factor IX; thrombosis; haemophilia; alpha thalassaemia; haemoglobin alpha locus 1; MLH1; APOR; mismatch repair; MSH6; hyperlipidaemia; apolipoprotein E; LDLR; familial hypercholesterane; MCPI; syndrome; APP; PSBN1; antisense; UDP-glucuronosyltransferase; amyloid precursor protein; presentlin-1; Alzheimer's disease; cytostatic; antisickling; antianaemic; haemostatic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Oligonucleotide for targeted alterations of genetic sequences and for treating cystic fibrosis, comprises at least one mismatch and chemical modification -
                                                                                                                                                                                                                                                                                                                                                                                                  Adenosine deaminase deficiency correcting oligo SEQ ID NO: 36.

```
The present invention provides single-stranded oligonucleotides which can be used for the targeted alteration of genomic sequences, where the oligonucleotide has at least one mismatch compared with the genomic sequence to be altered. In particular, these sequences are directed at the following genes: adenosine deaminase, p53, beta-globin, retinoblastoma, BRCA1, BRCA2, CFTR, cyclin-dependent kinase inhibitor 2A (CDKN2A), APC, Pactor VIII, Factor IX, haemoglobin alpha locus 1 (HBA2), MH11, MR22, MK32, MK32,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human; gene therapy; adenosine deaminase deficiency; p53; beta-globin; retinoblastoma; BRCA1; BRCA2; CFTR; cystic fibrosis; cancer; Factor V; cyclin-dependent kinase inhibitor 2A; CDKN2A; melanoma, APC; HBA1; HBA2; adenomatous polyposis of the colon; Factor VI; Factor IX; thrombosis; haemophilia; alpha thalassaemia; haemoglobin alpha locus 1; MLH1; APOE; mismatch repair; MSH2; MSH6; hyperlipidaemia; apolipoprotein B; LDLR; familial hypercholesterolaemia; UGTI; syndrome; APP; FSENI; antisense; UDP-glucuronosyltransferase; amyloid precursor protein; presentilin-1; Alzheimer's disease; cytostatic; antisickling; antianaemic; haemostatic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Oligonuclectide for targeted alterations of genetic sequences and for treating cystic fibrosis, comprises at least one mismatch and chemical modification -
various syndromes. The present sequence is one of the gene correcting oligonucleotides of the invention.
                                                                                                                                                                                                        Gaps

The present invention provides single-stranded oligonucleotides which can be used for the targeted alteration of genomic sequences, where the oligonucleotide has at least one mismatch compared with the genomic sequence to be altered. In particular, these sequences are directed at the following genes: adenosine deaminase, p53, beta-globin, retricoblastoma, BRCA1, BRCA2, CFFR, cyclin-dependent kinase inhibitor 2A (CDKN2A), Apc. Factor V, Factor VII, Factor IX, haemoglobin alpha locus 1 (HBA2), haemoglobin alpha locus 2 (HBA2), MLH1, MSH2, MSH6, apolipoprotein E (APOR), LDL receptor (LDIA), upp-glucuronsyltransferase (UGT1), amyloid precursor protein (APC), presentlin-1 (BSBN1) and presentlin-2 (PSBN2). These can be used in the gene therapy of diseases such as cancer, adenosine deaminase deficiency, cystic fibrosis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human; gene therapy; adenosine deaminase deficiency; p53; beta-globin; retinoblastoma; BRCA1; BRCA2; CFTR; cystic fibrosis; cancer; Factor V; cyclin-dependent Kinase inhibitor 2A, CDKN2A; melanoma; APC; HBA1; HBA2; adenomatous polyposis of the colon; Factor VII; Factor IX; thrombosis; haemophilia; alpha thalassaemia; haemoglobin alpha locus 1; MLH1; APOB; mismatch repair; MSH6; hyperlipidaemia; apolipoprotein B; LDLR; familial hypercholesterolaemia; UGT1; syndrome; APP; PSRN1; antisense; UDP-glucuronosyltransferase; amyloid precursor protein; presentlin-1; Alzheimer's disease; cytostatic; antisickling; antianaemic; haemostatic;

The present invention provides single-stranded oligonucleotides which can be used for the targeted alteration of genomic sequences, where the oligonucleotide has at least one mismatch compared with the genomic sequence to be altered. In particular, these sequences are directed at the following genes: adenosine deaminase, p53, beta-globin, retinoblastoma, BRCA1, BRCA2, CFTR, cyclin-dependent kinase inhibitor 2A (CDKNAA), APC, Factor V, Factor IX, haemoglobin alpha locus apolipoprotein E (APOE), LDL receptor (LDLR), UDP-glucuronosyltransferase (UGT1), amyloid precursor protein (APC), presentlin-1 (PSEN1) and presentlin-2 (PSEN2). These can be used in the gene therapy of diseases
                                                                                                                                                                 0;

Oligonucleotide for targeted alterations of genetic sequences and for treating cystic fibrosis, comprises at least one mismatch and chemical modification -

Claim 7; Page 43; 294pp; English.

The present invention provides single-stranded oligomucleotides which can be used for the targeted alteration of genomic sequences, where the oligomucleotide has at least one mismatch compared with the genomic sequence to be altered. In particular, these sequences are directed at the following genes: adenosine deaminase, p53, beta-globin, retinoblastoma, BRCA1, BRCA2, CFTR, cyclin-dependent kinase inhibitor 2A (CDNNAA), APC, Factor V, Factor II, Factor IX, haemoglobin alpha locus (HBA2), MH1, MBH2, MSH2, MSH6, apolloprotein E (APOB), LDL receptor (LDLR), uDP-glucuronosyltransferase (UGI1), amyloid precursor protein (APC), presenilin-1 (PSEN1) and

Oligonucleotide for targeted alterations of genetic sequences and for treating cystic fibrosis, comprises at least one mismatch and chemical Claim 7; Page 251; 294pp; English.

The present invention provides single-stranded oligonucleotides which can be used for the targeted alteration of genomic sequences, where the oligonucleotide has at least one mismatch compared with the genomic sequence to be altered. In particular, these sequences are directed at the following genes: adenosine deaminase, p53, beta-globin, retinoplastoma, BRCA1, BRCA2, CFFF, cyclin-dependent kinase inhibitor 2A (CDKWA2A), APC, Factor V, Factor VIII, Factor IX, haemoglobin alpha locus 1 (HBA1), haemoglobin alpha locus 2 (HBA2), MLH1, MSH2, MSH6,

```
Generating multiple copies of polynucleotide complementary to RNA, by amplifying RNA with composite primer, second primer, and strand displacement to generate DNA products comprising sequences complementary to RNA.
                                                                                                                                                                                                                                                                                                                                 Nucleic acid sequencing; gene expression; nucleic acid amplification; LGALS1; PCR; primer; ss.

complementary to RNA sequence. The method involves extending first primer hybridized to target RNA (I) with enzyme to form complex having first primer extension product (EPI) and (I), cleaving (I) from the complex, extending second primer hybridized to EPI with enzyme to form complex. Artificial EPI and EP2, and cleaving RNA from the composite primer in the complex. The method is useful for sequencing RNA sequence of interest; for for detecting a mutation in a target RNA using single stranded of a conformation polymorphism; for determining presence or absence of a sequence of interest; for producing a nucleic acid immobilized to a substrate; for characterizing an RNA sequence of interest; for producing a nucleic acid immobilized to a conformation profession profession profession profession profession in a sample; and for preparing a library. The method is also useful for differential amplification of one or more sequence of interest, and for making a cDNA library by preparing a subtractive hybridization probe. Sequences ABV3113-120 represent prime rather cDNA or amplification of the four specific expressed genes in either cDNA or amplification products generated using the method of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 유
                                                                                                                                                                                                                                                                                                                                                                               The present invention describes human secreted and transmembrane PRO proteins. The PRO proteins have cytostatic activity. The PRO proteins can be used for targeted delivery of bioactive molecules, such as toxins, radiolabels or antibodies, that cause cell death. PRO nucleotide sequences, and their fragments, can be used as hybridisation probes, in chromosomal and gene mapping, and in the generation of anti-sense RNA and DNA. They may also be used to produce transgenic animals which are used to develop and screen therapeutically useful reagents. The PRO nucleotide and protein sequence can be used for tissue typing and in treating cancer. Anti-PRO antibodies can be used in diagnostic assays. AAF44270 to AAF44470 represent PCR primers and hybridisation probes used in the isolation of human PRO sequences. AAF44087 to AAF44269 and AAB65164 to AAB65300 represent human PRO polynucleotide and protein sequences given in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ó
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

The present invention relates to human testis expressed Patched like protein (HTPL, see ABV78759 to ABV78762 and ABB98519 to ABB98520). HTPL has two isoforms, with a few single base pair differences between the two. One of the single base pair changes introduces a premature stop codon in HTPL-S (S for short) compared to HTPL-L (L for long). HTPL shares an overall structure organisation with the Patched protein. The shares an overall structure organisation with the Patched protein. The shares an overall structure organisation with the Patched protein. The shares an overall structure organisation with the Patched protein. The cotate of Patched, and is a potential tumour suppressor. HTPL is contract in regulating male germ cell development, and the HTPL gene was important in regulating male germ cell development, and the HTPL and in the therapy and manufacture of a medicament for treatment or prevention of therapy and manufacture of a medicament for treatment or prevention of therapy and manufacture of a medicament for treatment or prevention of the HTPL. Such disorders associated with decreased expression or activity of human HTPL. Such disorders include disorders of testis, or adrenal, adult and fortal muscle or colon function. HTPL proteins and mucleic acids are clinically useful diagnostic markers and obtenial therapeutic agents for male infertility and cancer. The present oligomucleotide was used in an example from the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; gene therapy; tumour suppressor; HTPL; chromosome 10p12.1; human testis expressed Patched like protein; testis; adrenal; liver; male germ cell development; bone marrow; brain; kidney; lung; placenta; prostate; skeletal muscle; colon; male infertility; cancer; ss.

The present invention relates to human testis expressed Patched like protein (HTPL, see ABV'8759 to ABV'8762 and ABB98519 to ABB98520). HTPL brotein (HTPL, see ABV'8759 to ABV'8762 and ABB98519 to ABB98520). HTPL has two isoforms, with a few single base pair diangerences between the two isoforms with a few single base pair changes introduces a premature stop codon in HTPL-S (S for short) compared to HTPL-L (L for long). HTPL codon in HTPL-S (S for short) compared to HTPL-L (L for long). HTPL codon in HTPL-S (S for short) compared to HTPL-S a role similar to that of Patched, and is a potential tumour suppressor. HTPL is comportant in regulating male germ cell development, and the HTPL gene was useful for diagnosing a disorder caused by mutation in HTPL, and in company and manufacture of a medicament for treatment or prevention of therapy and manufacture of a medicament for treatment or prevention of such disorders associated with decreased expression or activity of human HTPL. Such disorders include disorders of testis, or adrenal, adult and HTPL. Such disorders include disorders of testis, or adrenal, adult and skeletal muscle or colon function. HTPL proceins and mucleic acids are clinically useful diagnostic markers and potenial therapeutic acids are colon function and potenial therapeutic acids are male infertility and cancer. The present oligonucleotide was used in an example from the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ..
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human, gene therapy; tumour suppressor; HTPL; chromosome 10p12.1; human testis expressed Patched like protein; testis; adrenal; liver; male germ cell development; bone marrow; brain; kidney; lung; placenta; prostate; skeletal muscle; colon; male infertility; cancer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Novel isolated human testis expressed Patched like protein (HTPL), useful for identifying agonist and antagonist and specific binding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             0

The present invention relates to human testis expressed Patched like protein (HTPL, see ABV78759 to ABV78762 and ABB98519 to ABB98520). HTPL protein (HTPL, see ABV78759 to ABV78762 and ABB98519 to ABB98520). HTPL brack will be a single base pair differences between the two isoforms, with a few single base pair differences between the two. One of the single base pair changes introduces a premature stop codon in HTPL-8 (8 for short) compared to HTPL-10 (L for long). HTPL shares an overall structure organisation with the Patched protein. The shares an overall structure organisation with the Patched protein. The shares an overall structure organisation with the Patched protein. The content of Patched, and is a potential tumour suppressor. HTPL is similar to that of Patched, and is a potential tumour suppressor. HTPL is see a mapped to human chromosome 10pl2.1. HTPL and its coding sequence are useful for diagnosing a disorder caused by mutation in HTPL, and in therapy and manufacture of a medicament for treatment or prevention of therapy and manufacture of a medicament for treatment or prevention of therapy and manufacture of a medicament for treatment or prevention of therapy and cancer include disorders of testis, or adrenal, adult and the HTPL. Such disponsition arkers and potential therapeutic acids are colinically useful diagnostic markers and potential therapeutic acids are male infertility and cancer. The present oligonucleotide was used in an example from the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; FOSH1 1; SH3 domain; POSH-like signalling protein 1; oncogene; Rho GPPase; signal transduction; gene expression; cancer; vaccine; gene therapy; transgenic; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ..

The invention relates to an isolated SH3 domain (POSH)-like signalling protein 1 (POSHL 1) polypeptide (I), comprising a sequence of 730 amino acids (SI, ABB83999), a sequence having 65% sequence of 6711, colling to (SI), and the sequence comprising at least 8 contiguous amino or a fragment of the sequences comprising at least 8 contiguous amino acids. Human POSHL 1 is a proto-oncogene/oncogene product that functions as an adaptor protein that interactes with Rho family small GTPases as well as downstream components of the signal transduction pathway. (I) is useful for identifying a specific binding partner. (I) and nucleic acids (II) conceded by altered expression of human POSHL1 including disease and treating caused by altered expression of human POSHL1 including diseases and (II) is treating cancer, they useful in the development of vaccines and (II) is useful for measuring and for suverying gene expression and creating are useful for measuring and for suverying gene expression and creating transgenic non-human animals capable of producing the proteins. The present sequence is that of a scanning oligonucleotide useful in examples
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ô
                                                                                                                                                                                                                                                                                                                                                                                                                              Note: The present sequence did not form part of the printed specification, but is based on sequence information supplied to Derwent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human; POSH1 1; SH3 domain; POSH-like signalling protein 1; oncogene;

The invention relates to an isolated SH3 domain (POSH)-like signalling correctin 1 (POSHL 1) polypeptide (I), comprising a sequence of 730 amino acids (SI, ABB83999), a sequence having 65% sequence identity to (SI), (SI) having 95% deviations, a sequence comprising a sequence identity to (SI), (SI) having 95% deviations, especially conservative substitutions or a fragment of the sequences comprising at least 8 contiguous amino acids. Human POSHL 1 is a proto-oncogene/oncogene product that functions as an adaptor protein that interacts with Rho family small Grases as well as downstream components of the signal transduction pathway. (I) is useful as concoding (I) are useful for diagnosing, monitoring disease and treating caused by altered expression of human POSHL1 including diagnosing and creating cancer, they useful in the development of vaccines and (II) is useful in gene therapy. (II) is useful for constructing microarrays which care useful for measuring and for surveying gene expression and creating cransgenic non-human animals capable of producing the proteins. The present sequence is that of a scanning oligonucleotide useful in examples of the measuring cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    of the invention.
Note: The present sequence did not form part of the printed
specification, but is based on sequence information supplied to Derwent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human; POSH1, 1; SH3 domain; POSH-like signalling protein 1; oncogene; Rho GTPase; signal transduction; gene expression; cancer; vaccine; gene therapy; transgenic; ss.
                                                                                                                                                                                                                                Novel human SH3 domain (POSH)-like signalling protein 1 polypeptide, POSHL-1, useful for treating disorders associated with decreased expression or activity of human POSHL1 -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Match 1.0%; Score 13.4; DB 1; Length 17; Local Similarity 93.3%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            RESULT 338
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ABV90552,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         à
                                                                                                                                                                                                                                                                            The invention relates to an isolated SH3 domain (POSH)-like signalling protein 1 (POSHL 1) polypeptide (I), comprising a sequence of 730 amino acids (SI, ABBB3999), a sequence having 65% sequence of 730 amino (CI) having 95% deviations, especially conservative substitutions or a fragment of the sequences comprising at least 8 contiguous amino acida. Human POSHL 1 is a proto-oncogene/oncogene product that functions as an adaptor protein that interacts with Rho family small Grases as well as communitying a specific binding partner. (I) and mucleic acids (II) encoding (I) are useful for diagnosing, monitoring disease and treating cancer, they useful in the development of vaccines and (II) is useful in gene therapy. (II) is useful for constructing microarrays which are useful for measuring and for surveying gene expression and oreating transgenic non-human animals capable of producing the proteins. The present sequence is that of a scanning oligonucleotide useful in examples
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Note: The present sequence did not form part of the printed specification, but is based on sequence information supplied to Derwent by the European Patent Office.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human, POSHL 1; SH3 domain, POSH-like signalling protein 1, oncogene, Rho GTPase; signal transduction, gene expression, cancer, vaccine;

The present invention relates to the isolation of novel human PRO polypeptides (AAU86128-AAU86162) and the polymucleotide sequences encoding them. The PRO polypeptides, agonists, antagonists or anti-PRO antibodies are useful for treating benign or malignant tumours (e.g. renal, kidney, bladder, breast, etc), leukaemias and lymphoid malignancies, other disorders such as neuronal, glial, astrocytal, hypothalamic, glandular, macrophagal, stromal and blastocoelic disorders, inflammatory, immune and angiogenic disorders. The polymucleotide sequences are also useful in gene therapy. The present sequence represents a PCR primer used in the methods of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Thirty five nucleic acids encoding PRO polypeptides, useful for treating benign or malignant tumours, leukaemias and lymphoid malignancies, inflammatory, angiogenic and immunologic disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 17 BP; 1 A; 4 C; 7 G; 5 T; 0 other;

The invention relates to an isolated SH3 domain (POSH)-like signalling protein 1 (POSHL 1) polypeptide (1), comprising a sequence of 730 amino acids (21, ABB83999), a sequence having 54 sequence of 631), (S1) having 954 deviations, especially conservative substitutions or a fragment of the sequences comprising at least 8 contiguous amino acids. Human POSHL 1 is a proto-oncogene/oncogene product that functions as an adaptor protein that interacts with Rho family small GrPases as well as downstream components of the signal transduction pathway. (I) is useful of for identifying a specific binding partner. (I) and nucleic acids (II) concounting (I) are useful for diagnosing, monitoring disease and treating caused by altered expression of human POSHL1 including diagnosing and treating caused by altered expression of human POSHL1 including diagnosing and treating caused by measuring and for surveying gene expression and creating are useful for measuring and for surveying gene expression and creating transgenic non-human animals capable of producing the proteins. The

The invention relates to enzymatic nucleic acid molecules that down regulate expression of chloride channel calcium activated 1 (CLCA1) genes by cleaving RNA derived from the genes. The nucleic acid sequences are useful as pharmaceutical agents for treating conditions such as chronic fibrosis, obstructive pulmonary disease (CCDPD), chronic bronchitis, asthma, cystic that are related to or will respond to the levels of CLCA1 in a cell or hence, are useful for treatment of a patient having a condition associated with the level of CLCA1, where the invention further comprises the use of one or more therapies under conditions suitable for the present the use of one or more therapies under conditions suitable for the treatment, for example, oxygen therapy, bronchodilators, corticosteroids, nucleic acids of the invention are also used as diagnostic agents. The examine genetic drift and mutations within diseased calls or to detect the presence of CLCAI RNA in a cell. This sequence represents an enzymatic nucleic acid molecule of the invention. Novel polynucleotide which down regulates expression of Ets-related gene, useful for treating cancer, diabetic retinopathy, macular degeneration, arthritis, psoriasis, verruca vulgaris and Sturge Weber syndrome

Claim 4; Page 78; 149pp; English.

The invention relates to a nucleic acid molecule (I) which down regulates expression of an Ets-related gene (EEG). (I) is useful for treating conditions selected from cancer. lymphoma, Ewing's sarcoma, melanoma, tumour angiogenesis, diabetic retinopathy, macular degeneration, tumour angiogenesis, diabetic retinopathy, macular degeneration, vertuca tumour angiogenesis, diabetic retinopathy, macular degeneration, vertuca cumour glaucoma, Wippel Trenaunay-Weber Syndrome, Osie-Weber-rendu CC wedgaris, angiofibroma of tubercous sclerosis, port-wine stains, Sturge syndrome, leukaemia, osteoporosis and wound healing. (I) is useful for treating a patient having a condition associated with the level of EEG, by contacting cells of the patient with (I) under conditions suitable for under conditions suitable for the treatment. Leukaemia or tumour conjunction with one or more of other therapies such as radiation or conjunction with one or more of other therapies such as radiation or conjunction with one or more of other therapies such as radiation or chemotherapy treatment. (I) is useful for reducing ERG activity in a coll.) by contacting the cell with (I). (I) is useful for clasving sample coll to diseases related to the expression of ERG, and as diagnostic tool tool context of the presence of ERG RNA in a cell. (I) is useful for specifically catamine genes that share homology with ERG gene or ERG fusion genes.

Cation such as MSZ2719 represent nucleic acids, including antisense and cargred enzymatic nucleic acid molecules which regulate expression of ERG, and enzymatic nucleic acid molecules which regulate expression of ERG, and cargrant enzymatic nucleic acid molecules which regulate expression of ERG, and enzymatic nucleic acid molecules.

Novel polynucleotide which down regulates expression of Ets-related gene, useful for treating cancer, diabetic retinopathy, macular degeneration, arthritis, psoriasis, verruca vulgaris and Sturge Weber syndrome

Claim 4; Page 78; 149pp; English.

The invention relates to a nucleic acid molecule (I) which down regulates expression of an Ets-related gene (ERG). (I) is useful for treating carbons and conditions selected from cancer, lymphoma, Ewing's sarcoma, melanoma, tumour angiogenesis, diabetic retinopathy, macular degeneration, cumour angiogenesis, diabetic retinopathy, macular degeneration, cumour angiogenesis, diabetic retinopathy, macular degeneration, or ungarial, angiofibroma of tuberous sclerosis, port-whose stains, Sturge Neber syndrome, Rippel-Trenaunay-Weber syndrome, Osler-Weber-rendu Syndrome, leukaemia, osteoporosis and wound healing. (I) is useful for treating a patient having a condition associated with the level of ERG, by contacting cells of the patient with (I) under conditions suitable for the treatment. Euckeamia or tumour angiogenesis is treated by administering (I) to the patient in conjunction with one or more of other therapies such as radiation or conjunction with one or more of other therapies such as radiation or conjunction with one or more of other therapies such as radiation or coll, by contacting the cell with (I) (I) is useful for cleaving RNA of ERG gene, by contacting the cell with (I) (I) is useful for cleaving RNA of ERG gene, by contacting the expression of ERG, and as diagnostic tool to examine genetic drift and mutations within diseased cells or to detect conference of ERG RNA in a cell. (I) is useful for specifically transpared mutations within diseased cells or to detect angesting genes that share homology with ERG gene or ERG fusion genes. ABK/1354-ABK/2719 represent nucleis added molecules which regulate expression of ERG, and exargmatic nucleic acide molecules which regulate expression of ERG, and related PCR primers of the invention.

Novel polynucleotide which down regulates expression of Ets-related gene, useful for treating cancer, diabetic retinopathy, macular degeneration, arthritis, psoriasis, verruca vulgaris and Sturge Weber syndrome

Claim 4; Page 126; 149pp; English.

The invention relates to a nucleic acid molecule (I) which down regulates expression of an Ets-related gene (ERG). (I) is useful for treating conditions selected from cancer, lymphoma, Ewing's sarcoma, metlanoma, tumour angiogenesis, diabetic retinopathy, macular degeneration, tumour angiogenesis, diabetic retinopathy, macular degeneration, cumour angiogenesis, diabetic retinopathy, macular degeneration, nervascular glaucoma, myopic degeneration, arthritis, psoriasis, verruca vulgaris, angiogenesis, stopel-Trenaunay-Weber syndrome, Osteoporosis and wound healing. (I) is useful for treating a patient having a condition associated with the level of ERG, by contacting cells of the patient with (I) under conditions suitable for the treatment. The method comprises the use of one or more therapies the treatment. Includacing suitable for the treatment. Includacing or under conditions suitable for the treatment. Leukacmia or tumour angiogenesis is treated by administering (I) to the patient in conjunction with one or more of other therapies such as radiation or chemotherapy treatment. (I) is useful for reducing ERG activity in a cell, by contacting the cell with (I). (I) is useful for cleaving RNA of ERG gene, by contacting (I) with RNA, in the presence of a divalent confinesses related to the expression of ERG such or to detect the presence of ERG RNA in a cell. (I) is useful for specifically confinesses that share homology with ERG gene or ERG fusion genes. ABMI1354-ABK22719 represent nucleic acide, including antisense and cerametric mucleic acid molecules which regulate expression of ERG, and cerametric mucleic acid molecules which regulate expression of ERG, and cerametric mucleic acid molecules which regulate expression of ERG, and cerametric mucleic acid molecules which regulate expression of ERG, and cerametric molecules which regulate expression of ERG, and cerametric molecules and cerametric mucleic acid molecules acid including antisense and cell molecules which regulate expression of ERG, and and cell molecu

New isolated nucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies and transfected cells

Disclosure; Page 603; 720pp; French

The invention relates to a novel isolated 17 mer mucleic acid sequence, given in the specification, a sequence containing at least 15 consecutive nucleotides from the 17 mer sequence, a sequence with, after optimal alignment, at least 80 % identity to the 17 mer sequence, a sequence that hybridizes to them under highly stringent conditions, or the complement of any of them, or the corresponding RNA. The novel isolated nucleic acids of the invention are useful as probes and primers for detecting, identifying, quantifying and/or amplifying a nucleic acid, e.g. as one component of a gene chip, in vitro as (anti) sense reagents, and for production of recombinant polypeptides. Any of the nucleic acids, polypeptides, vectors containing the nucleic acids, polypeptides, vectors containing the nucleic acids, polypeptides, vector or antibodies directed against the polypeptides are useful for proparation of pharmaceuticials for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell degeneration, specifically cancer but also Alzheimer's disease and any any of the life and any or any any of the supression of the 17 mer nucleic acids in a striant paramles is nearly the expression of the 17 mer nucleic acids in a striant paramles is nearly the expression of the 17 mer nucleic acids in patient samples is useful for diagnosis and/or prognosis of these diseases. The polypeptides can also be used to generate antibodies, and both the polypeptide and antibodies are useful as components of protein chips. The nucleic acid sequences of the invention can be used in gene therapy. This polymucleotide sequence represents a tumour suppression related human fukutin oligonucleotide of the invention.

New isolated nucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies and transfected cells

Disclosure; Page 691; 720pp; French.

The invention relates to a novel isolated 17 mer nucleic acid sequence, given in the specification, a sequence containing at least 15 consecutive nucleotides from the 17 mer sequence, a sequence with, after optimal alignment, at least 80 % identity to the 17 mer sequence, a sequence that hybridizes to them under highly stringent conditions, or the complement of any of them, or the corresponding NNW. The novel isolated nucleic acids of the invention are useful as probes and primers for detecting, identifying, quantifying and/or amplifying a nucleic acid, as one component of a gene chip, in vitro as (anti)sense reagents, and for production of recombinant polypeptides. Any of the nucleic acids, polypeptides, vectors containing the nucleic acids, cells containing the peparation of plarmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell cleaneration, specifically cancer but also Albreimer's disease and schizophrenia. Analysis of the expression of the 17 mer nucleic acids in patient samples is useful for these patients and the containing the containing the patient samples is useful for diagnosis and/or progness and seconds. diseases. The polypeptides can also be used to generate antibodies, and both the polypeptide and antibodies are useful as components of protein chips. The nucleic acid sequences of the invention can be used in gene therapy. This polynucleotide sequence represents a tumour suppression related human fukutin oligonucleotide of the invention.

The invention describes an isolated human PRO polypeptide. The PRO polypeptides are useful in detecting PRO polypeptides in a sample, in linking a bioactive molecule to a cell expressing a PRO polypeptide, and in modulating at least one biological activity of a cell expressing a PRO polypeptide. PRO1312 stimulates hypertrophy of neonatal heart and is thus useful for treating cardiac insufficiency disorders. PRO1154 and PRO1186
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel isolated PRO polypeptides e.g., PRO826, PRO1068, PRO1184, PRO1346 and PRO1375, which stimulate proliferation of stimulated T-lymphocytes are therapeutically useful for enhancing immune response and in cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Godowski PJ;

stimulate adremal cortical capillary endothelial growth, and PRO536, PRO943, PRO828, PRO168 or PRO535, PRO943, PRO828, PRO168 or PRO535, PRO943, PRO828, PRO168 or PRO535, PRO943, PRO943, PRO1126, PRO160 and PRO187, induce c-fos in endothelial cells, and are thus cueful for treating conditions or disorders where angiogenesis would be beneficial, e.g. wound healing and antagonist of this polypeptide are useful for treating conditions two stimulated this polypeptide are endothelial growth factor (VEGF) Stimulated proliferation of endothelial growth factor inhibiting endothelial cell growth in mammals which would be beneficial in inhibiting tumour growth. PRO826, PRO1068, PRO1184, PRO1346 and PRO1135 stimulate proliferation of stimulated T-lymphocytes and are therapeutically useful for enhancing immune response. PRO826, PRO108 or PRO1132 enhance survival/proliferation of retinal neurons cells (PRO1132 is also enhances survival/proliferation of disorders of injuries, e.g. retinitis pigmentosum, AMD. PRO819, PRO813 and therefore are useful for treating kidney disorders associated with dermaltian kidney mesangial cells, and therefore are useful for treating kidney disorders associated with dermaltis, herpetiformis or Crohn's disease. PRO110, PRO844, PRO112, PRO1192 and PRO1187 induce the comprehence are thus useful for treating sports and PRO1186. This care thus useful for treating sports and arthritis. This care thus useful for treating sports in polymucleotide.
                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; probe; ss; PRO; secreted; transmembrane; pharmaceutical; diagnostic; blosensor; bloreactor; tumour; therapeutic; Taqman; gene therapy; tumour-associated antiqenic target; TAT; ADEPT; antibody-dependent enzyme mediated prodrug therapy; cytostatic.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          04-JUN-1998
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  25-FEB-1998
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           APR-1998
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 05-JUN-1
  The invention discloses isolated PRO secreted/transmembrane polypeptides comprising a sequence without signal peptide and the nucleic acid encoding them. The polypeptides can be used to raise antibodies that specifically bind to the PRO polypeptide, for linking a bioactive molecule to a cell expressing a PRO protein and for modulating at least one biological activity of a cell. The PRO polypeptides or polympetides are also useful in gene therapy, in chromosome dentification, as chromosome markers, or in generating probes. The PRO polympetides are useful as molecular markers for protein properties are useful as molecular markers. The PRO polypeptides and nucleic acids may also be used in tissue typing, Anti-PRO antibodies are useful in diagnostic assays for PRO, and in affinity purification of PRO from recombinant cell culture or natural sources. The sequences presented in ABX90083-ABX90468 are the genes encoding, the primers amplifying and the probes detecting the PRO polymucleotides of the invention.

Probes detecting the PRO polymucleotides of the invention.

The invention discloses isolated PRO secreted/transmembrane polypeptides comprising a sequence without signal peptide and the nucleic acid encoding them. The polypeptides can be used to raise antibodies that encoding them. The polypeptide, for linking a bicactive encoding them. The properties, for linking a bicactive molecule to a cell expressing a PRO polypeptide, for linking a bicactive molecule to a cell expressing a PRO protein and for modulating at least on the properties of the properties of the properties of the properties of conclusivity of a cell. The PRO polypeptides or polynucleotides are also useful as pharmaceuticals, diagnostics, biosensors or bioreactors, for detecting or treating e.g. tumours in mannals, e.g. humans, dogs, cats, cattle, horses, sheep, pigs, goats or rabbits as targets for therapeutic intervention in certain cancers (e.g. colon, lung or breast cancers) and diagnostic determination of the presence of these cancers. The PRO polypeptides are also useful as molecular weight markers or for for homosome identification. The PRO genes are useful as hybridisation probes or for screening libraries of human cond. Agnowic or mRNA, The PRO genes may also be used in gene therapy, particularly for replacing a defective gene. The sequences presented in ABX79290-ABX79675 are the genes encoding, the primers among the primers of the propes detecting the PRO polynucleotides of the

acid molecule or an enzymatic nucleic acid molecule, that modulates expression of a nucleic acid molecule encoding HER2. K-Ras, H-Ras, N-Ras, human immunodeficiency virus (HIV) or a component of HIV. The nucleic acid molecule of the invention has cytostatic, anti-HHV, and anti-rheumatic activity. The nucleic acid molecules are useful for reducing HER2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic acids are also useful for treating breast, ovarian, colorectal, lung, prostate, bladder, or pancreatic cancer, and HIV infection, and AIDS. The sequences shown in ABZ56989 - ABZ65151, ABZ64544 - ABZ65531, ABZ66520 - ABZ66585 represent substrate/target sequences for the human ribozymes of the invention.
                                                                                                                                                                                                                        The invention relates to a novel short interfering RNA (siRNA) nucleic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Novel short interfering RNA and enzymatic nucleic acid useful for treating cancer, modulates the expression of a nucleic acid encoding HER2, K-Ras, H-Ras, N-Ras, and human deficiency virus sequences
                                                                                                                 Novel short interfering RNA and enzymatic nucleic acid useful for treating cancer, modulates the expression of a nucleic acid encoding HER2, K-Ras, H-Ras, N-Ras, and human deficiency virus sequences

The nucleic acid molecule of the invention has cytostatic, anti-HIV, and anti-rheumatic activity. The nucleic acid molecules are useful for reducing HRR2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic acids are also useful for treating breast, ovarian, colorectal, lung, prostate, bladder, or pancreatic cancer, and HIV infection, and AIDS.
                                     invention relates to a novel short interfering RNA (siRNA) nucleic
                                                    acid molecule or an enzymatic nucleic acid molecule, that modulates expression of a nucleic acid molecule encoding HRR2, K-RRS, H-RAS, N-Rhuman immunodeficiency virus (HIV) or a component of HIV. The nucleic acid molecule of the invention has cytostatic, anti-HIV, and anti-rheumatic activity. The nucleic acid molecules are useful for reducing HRR2, K-Ras, and HIV activity in a cell. The nucleic acids are also useful for treating breast, ovarian, colorectal, lung, prostate, bladder, or pancreatic cancer, and HIV infection, and AIDS. The sequences shown in RBZ59899 - ABZ65216, ABZ65231, ABZ6520 - ABZ65216, ABZ65531, sequences for the human ribozymes of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel short interfering RNA and enzymatic nucleic acid useful for treating cancer, modulates the expression of a nucleic acid encoding HER2, K-Ras, H-Ras, N-Ras, and human deficiency virus sequences
                                                                                                                                                                                                                                                                                                                                                                                Gaps

acid molecule or an enzymatic nucleic acid molecule, that modulates burnession of a nucleic acid molecule encoding HER2, K-Ras, H-Ras, N-Ras, human immunodeficiency virus (HIV) or a component of HIV. The nucleic acid molecule invention has cyrostatic, anti-HHV, and anti-rheumatic activity. The nucleic acid molecules are useful for reducing HER2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic acids are also useful for treating breast, ovarian, colorectal, lung, The sequences shown in ABZS989 - ABZ66216, ABZ66531, ABZ66530 - ABZ66531, ABZ66531 - ABZ66531, ABZ66530 - ABZ66531, ABZ66531 - ABZ66531 in the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a novel short interfering RNA (siRNA) nucleic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel short interfering RNA and enzymatic nucleic acid useful for treating cancer, modulates the expression of a nucleic acid encoding HBR2, K-Ras, H-Ras, N-Ras, and human deficiency virus sequences
The sequences shown in ABZ59889 - ABZ62216, ABZ64544 - ABZ65531, ABZ66520 - ABZ66524, ABZ66530 - ABZ66585 represent substrate/target sequences for the human ribozymes of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; ribozyme; short interfering RNA; siRNA; HER2; K-Ras;

The PRO polypeptides are secreted and transmembrane proteins. The PRO polypeptides are useful for detecting other PRO polypeptides, for linking bioactive molecules to cells expressing PRO polypeptides, for for modulating biological activities of cells expressing PRO polypeptides. PRO polypeptides, and for for identifying agonists or antagonists. The polynucleotide sequences encoding PRO polypeptides are useful as the polynucleotide sequences encoding PRO polypeptides are useful as the polynucleotide sequences encoding PRO polypeptides are useful as dark and in chromosome and gene mapping, in the generation of entisense RNA and DNA, in the preparation of PRO polypeptides, for generating transgenic animals or knockout animals, to construct
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Novel secreted and transmembrane polypeptide for modulating biological activity of cell expressing the polypeptide, identifying agonists or antagonists of polypeptide, and as molecular weight markers -

Human, PRO, probe, ss, secreted polypeptide, transmembrane polypeptide, toxin, radiolabel, cell death, gene mapping, chromosome mapping, protein electrophoresis, genetic disorder, immunosuppressive, cytostatic,
hybridisation probes for mapping the gene which encodes the PRO polypeptide, and for the genetic analysis of individuals with genetic disorders, in gene therapy, for chromosome identification, as chromosome markers, and for generating probes for PCR, Northern analysis, Southern analysis and Western analysis. The present sequence represents a PCR primer used in the examples of the present
                                                                                                                                                                                      Gaps
                                                                                   Note: The sequence data for this patent was obtained in electronic format directly from the USPTO web site at seqdata.uspto.gov/psipsDIDEntry.html.

                                                                                                                                                                 The invention relates to a secreted and transmembrane polypeptide, termed PRO polypeptide, and the polynucleotide encoding it. The polypeptide is useful for detecting PRO polypeptides and for linking a bioactive molecule to a cell expressing the above polypeptides, where the bioactive causes the death of the cell. The polypeptide, The bioactive material agonists or antagonists of the PRO polypeptide, for preparing variants of PRO, as a molecular weight marker for protein electrophoresis purposes and the PRO polypucleotide is useful for recombinantly expressing those markers. The polynucleotide is useful for recombinantly expressing those markers. The polynucleotide is useful for recombinantly expressing those chromosome and gene mapping, in generation of antisense RNA and DNA, in the preparation of PRO polypeptide, for generating transgenic animals or knocked animals which in turn are useful in the development animals or knocked animals.
                                                                                                                                                                                                                                                                                                                                                                                                                                  screening of therapeutically useful reagents, to construct hybridisation probes for mapping the gene which encodes PRO and for the genetic analysis of individuals with genetic disorders, in gene therapy, for chromosome identification, as a chromosome marker and for generating probes for PCR, Northern analysis, Southern analysis and Western analysis. This sequence represents a human PRO probe of the invention.
                                                    Novel secreted and transmembrane polypeptide for modulating biological
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 immunosuppressants; immunoenhancers; treatment; diagnosis; screening; immune disorders; transporter peptides; proteasome complex; MMC class I molecules; HLA; antigen processing; antigen presentation; autoimmune disease; ankylosing spondylitus; prenatal diagnosis; polymerase chain reaction; se

                                                                                                                                                                                                                                                                                                                                                                                       The sequences (AAO52824-Q52880) are pref. Cytomegalovirus target sequences for enzymatic RNA molecules. The RNA molecules are complementary to a substrate binding region in the specified gene target. They also have enzymatic activity, in that they specifically cleave RNA in the target. The ERMs interfere with viral replication and therefore have anti-viral properties. They can be used to attenuate viruses to be used in vaccines.

Synovial membrane of joints for the treatment or prevention of arthritis, particularly osteoarthritis or rheumatoid arthritis. The ENA's can also be used to treat antigen presenting cells of a donor to induce tolerance in a recipient to an alloantigen of a donor. They can also be used for treating graft tolerance or for treating autoimmune disease, and for treating allergies and other inflammatory conditions. The ENA's can also be used in diagnosis. Ribozyme therapy impacts on the expression of stromelysis without introducing the non-specific effects upon gene expression which accompany treatment with retinoids and dexamethasone. The concentration of ribozyme required to affect a therapeutic treatment is lower than that required of antisense molecules, and is highly specific. The present sequence is used in the exemplification of the The present invention describes a novel enzymatic nucleic acid (ENA) having a hammerhead motif (HM) comprising: (i) at least 5 ribose residues; (ii) a 2'-C-allyl modification at position 4 of the ENA; (iii) at least ten 2'-O-methyl modifications; and (iv) a 3'-end modification. The ENA's can inhibit collagenase and stromelysin production in the Enzymatic nucleic acid molecules having a hammer-head motif - used for the treatment of arthritis, induction of graft tolerance or McSwiggen J, Pavco P, Stinchcon A, Modak A, Usman N, Burgin A; s T, Thompson JD, Wincott F; Sequence 18 BP; 3 A; 3 C; 2 G; 10 U; 0 other; Claim 10; Page 216; 307pp; English. treatment of auto-immune diseases 1.0%; Beigelman L, Karpeisky A, Matulic-Adamic J, Jarvis T, WPI; 1996-300653/30. Galpha-16 is a human G protein which interacts differentially with several receptor types including members of the opioid and chemokine receptor families. A series of antisense oligonucleotides have been designed to target different regions of human Galpha-16 RNA. They may be used to inhibit the expression of Galpha-16 in human calls and tissues and thus to treat diseases associated with Galpha-16, such as hyperproliferative disorders, especially cancer. Infections, inflammation or tumour formation can be prevented or delayed. The compounds can be used in research and diagnostics in sandwich and other assays.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human; G-alpha-16; G protein; cytostatic; hyperproliferative disorder; cancer; inflammation; infection; antisense inhibition; ss.
                                                                                                   This is the nucleotide sequence of a PCR primer used in the method of the invention, involving the use of novel apoptosis-related DNAs and proteins. The inventions can be used as diagnostic reagents for apoptosis e.g. (monoclonal) antibodies for the protein, as a reagent in immunohistological staining, as apoptosis inhibitors. It can also be used for treatment of apoptosis-related diseases.
                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Note: The sequence has a phosphorothicate backbone and may be either an oligodeoxynucleotide or a chimeric oligonucleotide containing 2'-methoxyethyl (2'-MOE) wings and a deoxy gap. The ISIS number given above corresponds to the oligodeoxynucleotide sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         A new antisense compound for inhibiting the expression of human G-alpha-16 and treating, preventing or delaying infections, inflammation or hyperproliferative disorders such as cancer -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This sequence represents an oligonuclectide used as a detection probe in an array for the detection of target analytes. The invention relates to the detection of target analytes in a sample using an electrode array. At least one electrode forms an assay complex consisting of a capture binding ligand covalently attached to the electrode, a target analyte, and an electron transfer moiety. An input signal is applied to the assay complex, and the resulting output signal is processed to detect the presence of the target analytes. Preferred analytes include proteins and nucleic acids. However, the analyte may also be an environmental solutant (pesticides, insecticides or toxins), a chemical (solvent or organic material), biomolecules (hormones, cytokines, proteins, lipids, carbohydrates, cellular membrane antigens and receptors), whole cells (prokaryotic and eukaryotic cells), viruses, and spores. The method
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      achieves higher signal to noise ratios to increase the detection limits
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Signal processing method useful for achieving higher signal to noise ratios and to increase detection limits of target analytes
                                                                                          Gaps

This sequence represents a signalling probe used in an example of the method of the invention. The invention relates to the detection of target analytes in a sample using an electrode array. At least one electrode forms an assay complex consisting of a capture binding ligand covalently attached to the electrode, a target analyte, and an electron transfer moiety. An input signal is applied to the assay complex, and the resulting output signal is processed to detect the presence of the target analytes. Preferred analytes include proteins and nucleic acids. However, the analyte may also be an environmental pollutent (pseticides, insecticides or toxins), a chemical (solvent or organic material), biomolecules (hormones, cytokines, proteins, lipids, carbohydrates, cellular membrane antigens and receptors), whole cells (prokaryotic and spores. The method achieves higher signal to noise ratios to increase the detection limits of the target analytes.
                                                                                                                                                                                                                                                             Detect, target analyte, electrode array, environmental pollutant; ss, pesticide, insecticide, toxin, chemical; virus, spore, signalling probe.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Signal processing method useful for achieving higher signal to noise ratios and to increase detection limits of target analytes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                            Partial signalling probe sequence used in analyte detection method.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ;

```
detection electrode with a covalently attached capture ligand and at least comprises concentrating the analyte in a detection chamber comprising a detection electrode with a covalently attached capture ligand to form an cassay complex comprising the analyte, ligand and at least 1 electron transfer moiety (ETM), and detecting the ETM with the the detection electrode. The method is particularly used for assaying nucleic acids or correctly but more generally the target analyte is any compound for which a binding partner is available, e.g. pesticide or other pollutants; the therapeutic or illicit drugs; whole cells; viruses etc. Particularly the capture ligands. Particular applications are detecting genes different capture ligands. Particular applications are detecting genes of effecting bacteria and viruses (e.g. for blood screening or testing water or foods); for forensic fingerprinting; for sequencing and for detecting successful gene amplification. The rate of complex formation is concessed, resulting in more sensitive detection, particularly down to course of the invention for detection of target sequences.
                                                                                                                                                                                                                                                                                                              Complex-forming assay for analyte, particularly nucleic acid, used e.g. in detecting genetic disease, with accelerated complex formation by electrophoretic concentration of analyte
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Target analyte; nucleic acid detection; capture ligand; pesticide; electron transfer moiety; pollutant; therapeutic drug; cancer; Alzheimer's disease; cystic fibrosis; blood screening; water testing; forensic fingerprinting; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                invention relates to a method of detecting a target analyte that
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            0

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to identification of genes and proteins of adipose tissue relating to obesity, particularly complications of visceral obesity including diabetes, hyperlipemia, hypertension, arteriosclerosis, hyperuricemia and sleep apnea syndrome. The genes arteriosclerosis and the proteins (AAV67598 *V6760) are used in the genetic diagnosis, prevention and treatment of adipose tissue related diseases. Sequences AAZ90640-51 represent PCR primers amplifying the human adipose

The invention relates to a method of detecting a target analyte that comprises concentrating the analyte in a detection chamber comprising a detection electrode with a covalently attached capture ligand to form an assay complex comprising the analyte, ligand and at least I electron transfer moiety (ETM), and detecting the ETM with the the detection transfer moiety (ETM), and detecting the ETM with the the detection transfer moiety (ETM), and detecting the ETM with the the detection transfer moiety (ETM), and detecting to ETM with the the detection transfer moiety (ETM), and detecting to ETM with the the detection of proteins, but more generally the target analyte is any compound for which a binding partner is available, e.g. pesticide or other pollutants, the method is used in array formats, optionally with many thousands of different capture ligands. Particular applications are detecting genes associated with cancer. Alzheimer's disease, cystic fibrosis etc.; detecting bacteria and viruses (e.g. for blood screening or testing water or foods), for forensic fingerprinting, for sequencing and for detecting successful gene amplification. The rate of complex formation is increased, resulting in more sensitive detection, particularly down to locable the present sequence represents a signalling probe used in the course of the invention for detection of target sequences.
                                                                                                              Complex-forming assay for analyte, particularly nucleic acid, used in detecting genetic disease, with accelerated complex formation by electrophoretic concentration of analyte

Antisense oligonucleotides that inhibit expression of human early growth response-1, useful for diagnosis, treatment and prevention of tumors, inflammation and infection

```
This invention describes novel antisense oligonucleotides (I) capable of inhibiting expression of human EGR-1 (early growth response-1). The products of the invention have anti-inflammatory, cytostatic and antiviral activity. (I) was tested for its effects on EGR-1 mRNA levels by real-time polymerase chain reaction (PCR), results indicated that 60% inhibition was achieved. When (I) was modified by 2'-O-methoxyethyl substitution of the first 4 and last 4 residues, and by replacing any C in these flanking regions with 5-methyl-C, the degree of inhibition was increased to 71%. (I) is used to inhibit expression of EGR-1 in cells and tissues in vitro, for research or diagnosis, e.g. detecting EGR-1 encoding nucleic acid. (I) may also be used to treat or prevent EGR-1-associated diseases, particularly viral infections, inflammation and tumors. AAZ44169 represent antisense primers used to inhibit
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Antisense compound which modulates human sentrin expression, useful for treating diseases associated with sentrin expression -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention describes an antisense compound (I) 8-30 nucleotides long targeted to a nucleic acid molecule encoding human sentrin. The antisense compound comprises a phosphorothicate antisense oligonucleotide which inhibits expression of human sentrin. (I) is

New antisense oligonucleotides for modulating the expression of inducible nitric oxide synthase in cells or tissues, particularly useful for treating e.g. immunological, cardiovascular or neurological disorders, or ischaemia

Claim 3; Page 84; 144pp; English.

The invention relates to antisense compounds, especially oligomucleotides, which are targeted to a nucleic acid encoding inducible nitric oxide synthase and which specifically hybridise to and modulate expression of inducible nitric oxide synthase. The antisense compounds have immunomodulator, antidiabetic, cardiovascular, cardiant, neuroprotective, disorder and vasotropic activity. The antisense oligomucleotides are useful for inhibiting the expression of inducible nitric oxide synthase in cells or tissues. In particular, the antisense

```
oligonucleotides are useful for treating diseases or disorders associated
                      with inducible nitric oxide synthase, e.g. diabetes, immunological disorder, cardiovascular disorder, neurological disorder or ischaemia-reperfusion injury. The antisense oligonucleotides are also useful for research and diagnostics. The present sequence is that of an antisense 2'-O-methoxyethyl gapmer oligonucleotide with a phosphorothicate backbone, a central "gap" region of ten nucleotides flanked by four nucleotide 2'-MOE (2'-methoxyethyl) wings and 5-methylcytidine residues throughout the oligonucleotide. The antisense olignucleotide is targeted to human inducible nitric oxide synthase (NOS)
                                                                                                                                                                                                                                                                                                         mRNA (AAH47973)

Determining a predisposition to epilepsy and/or development of epilepsy comprises determining the genotype of SCNIA, SCNIA and/or SCNIA, or a DNA variant, equivalent, or mutation which shows a linkage disequilibrium -

Example 3; Fig 2; 268pp; English.

The present invention describes a method (M1) of determining an individual's predisposition to epilepsy and/or development of epilepsy, as well as predisposition to epilepsy and/or development of epilepsy, method comprises determining the genotype of at least one gene selected from SCN1A, SCN2A or SCN3A, or a DNA variant, equivalent, or mutation which shows a linkage disequilibrium. SCN1A, SCN2A and SCN3A are all sodium channel genes located on chromosome 2. The idiopathic generalised epilepsy (1GB) gene is more specifically localised on chromosome 2q23-q31. Compounds identified as modulators of the biological activity of SCN1A, SCN2A or SCN3A proteins or genes, are useful for treating epilepsy or other neurological disorders. They have anticonvulsant and neuroprotective activities. AAHS5763 to AAHS6164 and AAB99674 to

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The specification describes antisense oligonucleotides which are targeted to a nucleic acid encoding Her-4 (a receptor/tyrosine kinase). The antisense oligonucleotides are used to inhibit the expression of Her-4 in cells or tissues in vitro. They can be used in diagnostics, therapeutics, prophylaxis and as a probe in research reagents. The

This accelerates the binding of the target analyte to the detection electrode. It can be used to detect target analytes in sample solutions, for example in genetic diagnosis, pathogen detection, DNA fingerprinting, sequencing and gene probe assays. The present sequence is an oligonucleotide used in the exemplification of
antisense oligonucleotides can be used to prevent or delay infection, inflammation or tumour formation. AAH25315-AAH25398 represent antisense oligonucleotides which are targeted to different regions of the human

The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotypin and monitoring gene expression. The present sequence is a probe used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                 Nucleic acids containing electron-transfer group, useful as labels in hybridization assays, e.g. for genotyping, allowing repeat analyses on
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence determination using electronic detection signalling probe #1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
